Discharge summary

Prepared for the Offline PDF Toolkit demo

This is a sample document generated for the toolkit's demo. It contains no real information. Its only job is to give the page grid something to render, so the screenshots and the live demo show the application doing actual work rather than sitting on an empty drop zone.

Each page carries a running header, a rule, a title and a block of text, which is enough to see how thumbnails crop, how rotation behaves, and how a watermark or a page number lands on the finished sheet.

Everything the application does happens inside the browser tab. The file is read into memory, the pages are rearranged with pdf-lib, and the result is handed back to the download prompt by the browser itself. There is no upload step because there is no server to upload to.
